APPL. NO.: 09-201090 [JP 97201090]
FILED: July 28, 1997 (19970728)
INTL CLASS: B42D-011/00

ABSTRACT

PROBLEM TO BE SOLVED: To provide a delivery slip which is simply manufactured and contains the details of a **message** to an addressee from a sender, of a **package**, to be kept **confidential** and accessible with the **addressee** upon the arrival of the **package**, when the **package** is dispatched by postal parcel, special home delivery services, railway transport and any other forwarding means.

SOLUTION: This delivery slip 10 comprises a delivery service slip part 2 on which delivery service information is printed and a **message** part 4 on which a confidentially handled **message** details addressed to a destination by a sender is printed, in a continuously integrated form. Especially the slip 10 is printed by a computer for **package** dispatch, and can be attached to a **package** to be sent by special home delivery services or through railway transport, and contains delivery service information which is positively available with a professional **package** forwarder. In addition, the details of the **message** from the **sender** of the **package** are kept **confidential** and are accessible with the **addressee** upon the arrival of the **package**. Thus it is possible to dispense with a work to form an attachment sheet into a bag shape and at the same time, prepare a letter containing a **message** separately to be sealed into the bag. Consequently, the efficiency of the dispatch work is increased and the effects to prevent a trouble with the failure to send the **message** from occurring are ensured.

(COMMUNICATION -- Telegraphy)

ABSTRACT

PROBLEM TO BE SOLVED: To maintain the **anonymity** of a **sender** and the security of a **receiver** by sending a mail back together with information regarding the **sender** if the information on the **sender** attached to the mail does not match **anonym** information and sending the information regarding the **sender** **anonymously** to the mail **receiver** side in case of matching.

SOLUTION: A network A where work stations 1 to 3 and a mail server 4 are connected to a communication line 7 and a network B where a work station 5 and a mail server 6 are connected to a communication line 9 are connected by a public line 8, to which a proxy mail server 10 is connected through a communication line 11. A **receiver** registers reception conditions of an **anonymous** mail to the proxy server 10, compares a mail that the proxy mail server 10 receives with the reception conditions of an **anonymous** mail, and sends the mail back to its **sender** when the conditions are not met or sends information regarding the **sender** (name, mail address, etc.) **anonymously** to the **receiver** when the conditions are met.

JAP10 CLASS: 30.1 (MISCELLANEOUS GOODS -- Office Supplies); 14.2 (ORGANIC CHEMISTRY -- High Polymer Molecular Compounds)

ABSTRACT

PROBLEM TO BE SOLVED: To provide a double postal card which enables information whose content **secrecy** needs to be protected against to be sent as **confidential** information to an **addressee** from an **addresser**, and information covering **secrecy** to be sent back as **confidential** information to the **addresser** from the **addressee**, in view of the fact that such **confidential** information is sent to the **addressee** by the **addresser** using an **envelope** through postal services with disadvantages such as complicity, mismatching and high cost.

SOLUTION: This double postal card consists of a **message** form for an **addressee** by an **addresser** and a **message** form for the **addresser** by the **addressee** across a folding line, and further, has a paper piece (A) connected to the free long side end of the **message** form for the **addressee** and a paper piece (B) connected to the free long side end of the **message** form for the **addresser**, across the folding line respectively. In addition, the opposite faces to the postage stamp faces of both **message** form for the **addresser** and **message** form for the **addressee** and the opposite faces of the paper piece (A) and the paper piece (B) are bonded respectively in such a manner that these bonded faces are **peelable**.

ABSTRACT

PURPOSE: To provide an electronic mail device capable of transmitting a mail by anonymity.

CONSTITUTION: When a sender generates the mail by a call originating input means 21G so as to transmit it by anonymity at this time, an anonymous flag is inputted to it so as to be converted into a transmission packet by a call originating packet means 21F and to be transmitted to the applying destination directory of a box 12 by a transmitting means 21E, a receiver obtains the reception packet by a receiving means 22A and the sender of 'anonymity' is displayed on a reception display screen by a display means 22B after that. In the meantime, when the receiver executes return as against the anonymous mail, The sender 'anonymity' on the reception display screen is copied on the destination of a return input screen by a return input means 22C, data in the sender area of the reception packet is copied on the destination area of the return packet by a return packet means 22D after that, return is executed to the above applying destination directory by a transmission processing and return is also executed as against the anonymous mail.

ABSTRACT

PURPOSE: To easily confirm the reception of opposite data without any telephone communication by a data sender by sending a receipt message to

the sender automatically when the recipient receives the data stored in a memory through the reception of confidentiality.

CONSTITUTION: In applying operation to output a confidentiality picture data stored in a memory 3 by a key of a key input device 8, a CPU 7 prints out the picture data of the memory 3 by a printer 11 when the number of key input is coincident with a pass word stored in a memory 5 in advance. Then an abbreviation of a confidential picture recipient and a routine text from the memory 4 and a date and a time data from a clock device 6 are read out and an image data generating device 9 generates an image data. An opposite telephone number is read from the memory 1, a transmission section 10 makes a dial and the generated image data is sent as a receipt of the confidential picture. Thus, the confidential picture sender confirms the reception of the picture by the opposite party automatically.

Abstract (Basic): RU 2195079 C1

NOVELTY - Invention is related to mailing services, specifically, to delivery of mail to addressee with use of potential of existing post offices and telecommunication networks. While sending correspondence remote user-addresser sends it in electronic form. It comes to mail server which identifies address of addressee and transmits traffic to proper automatic mail box for traffic reception where electron traffic is automatically converted to paper form and is sealed in envelope with address of addressee. If automatic mail box is located in post office of settlement then sealed envelope is received by postman who delivers envelope to address specified on it.

USE - Computer engineering.

ADVANTAGE - Reduced time of delivery of mail from addresser to addressee with preservation of confidentiality of mail. 5 cl, 6 dwg pp; 0 DwgNo 1/1

Abstract (Basic): US 20020087641 Al

NOVELTY - A sender's physical electronic mail (e - mail) address and identification information are input to a client control program. An alias e - mail address generated by an alias e - mail server (100) is received by the client program and transmitted to a recipient. A message received from the recipient by the server to the alias address, is forwarded to the client program together with the identification information.

DETAILED DESCRIPTION - An INDEPENDENT CLAIM is included for e - mail control and organize system in computer data communication network.

USE - For use in computer data communication networks such as Internet.

ADVANTAGE - Unsolicited e - mail messages are greatly prevented by not revealing true e - mail address of e - mail sender but rather by using a series of alias addresses.

DESCRIPTION OF DRAWING(S) - The figure shows the block diagram of e - mail system.

Alias e - mail server (100)

FR 2821220 A1 H04L-009/28

Abstract (Basic): WO 200267535 A2

NOVELTY - The secure messaging method comprises a step to validate the user's authenticity by comparing a pass phrase value sent by the user with that stored in a database. The message prepared on the client station is subsequently enciphered and/or signed with the message recipient's private keys and/or the user's private key respectively.

DETAILED DESCRIPTION - The secure messaging method comprises a step to authenticate the user and to validate the user's authenticity by comparing the value derived from a pass phrase sent by the user with that stored in a database, together with the identifier of the user. The key pair is sent to the user station by the server and the message prepared on the client station is subsequently enciphered and/or signed with the message recipient's private keys and/or the user's private key respectively. The message transmission is performed through the establishment of virtual channels (VPN) for the enciphering and/or signing. The message is compressed and transmitted by means of streaming without being temporarily stored in the memory of the client station, the server or a peripheral station.

USE - Secure message transmission.

ADVANTAGE - Ensures confidentiality and integrity of message transmission.

DESCRIPTION OF DRAWING(S) - The diagram shows the architecture of the message transmission system.

Abstract (Basic): KR 2001065552 A

NOVELTY - A method for matching a couple using an E - mail not exposing a sender is provided to couple man and woman using an E - mail hiding a sender.

DETAILED DESCRIPTION - A sender transmits an E - mail A, not exposing his name, to a recipient anonymously using a site of Dearmylove. The recipient, receiving the E - mail A, estimates the sender of the E - mail A and replies a letter. In this case, the recipient has to register in the site Dearmylove before he can send an E - mail B to the sender. In case that the recipient hits the right sender by chance, the two people are matched. If the two people are not matched, the recipient of the E - mail B estimates the sender of the E - mail B in the same manner and sends an E - mail C to the site Dearmylove anonymously.

Abstract (Basic): GB 2361335 A

NOVELTY - **Message** senders transmit target user profile along with **message** content to server, to selectively send the **messages** to desired users having profile matching with the target profile. The server compares the target profile with all user profiles based on which the **message** content is allocated to the matching users.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

- (a) **Message** allocation method;
- (b) **Message** sending or reception method;
- (c) Communication arrangement;
- (d) Server apparatus;
- (e) User apparatus;
- (f) Storage medium for storing instructions for controlling processors;

(g) A signal carrying instructions for controlling processors USE - For allocating and distributing **messages** to specific users of data network such as Internet.

ADVANTAGE - The need to store a separate copy of the same **message** for each recipient is eliminated by allocating the same **message** simultaneously to a number of recipients. The **message** recipient can determine useful information about the **message** sender, without compromising privacy or anonymity of **message** sender or recipient

DESCRIPTION OF DRAWING(S) - The figure shows a schematic illustration of a data storage arrangement of a communication network. pp; 113 DwgNo 4/22

Abstract (Basic): JP 2001306455 A

NOVELTY - The server stores the generated temporary mail addresses matched with the original mail addresses. The temporary mail addresses of sender and receiver are matched to form an anonymous correspondence pair with respect to an effective term data for the pair while sending an e-mail. The anonymous correspondence pair of e-mail addresses are erased, based on the effectiveness term data.

USE - For electronic-mail exchange in internet for providing services such as chat and electronic bulletin board service using temporary mail addresses.

ADVANTAGE - Since temporary mail addresses are used, communication security is increased.

DESCRIPTION OF DRAWING(S) - The figure shows the e-mail transmission process, schematically. (Drawing includes non-English language text).

NOVELTY - **Anonymous** profile handler (150) estimates **recipient** list based on profile information output by sender defining recipient characteristics. Recipient handler (160) receives list and encrypt decryption key of **message** by recipient key. Integrator (170) receives encrypted **message** from encrypt or, decryption key and sends encrypted **message** with associated decryption key to concerned recipient.

DETAILED DESCRIPTION - An INDEPENDENT CLAIM is also included for anonymous **message** transmission method.

USE - For **message** transfer in network, maintaining **anonymity** of **message** recipient to **message** sender.

ADVANTAGE - **Anonymous** profile handler ensures that all communication between various elements are secured and authenticated, to prevent an attack on the integrity of the system by eavesdroppers, impersonators.

DESCRIPTION OF DRAWING(S) - The figure shows the simplified block diagram of **message** providing system comprising anonymous profile handler.

WO 200062158 A2 E 36 G06F-009/00

Designated States (National): CA IL JP

Designated States (Regional): AT BE CH CY DE DK ES FI FR GB GR IE IT LU MC NL PT SE

Abstract (Basic): WO 2000062158 A2

NOVELTY - Communication between multiple processes is established through an intelligent agent process such that intended **senders** and **receivers** are **hidden** from each other. The details of each process is stored in a storage accessible by the intelligent agent process and the details of one process are accessed when another process desires to communicate with it.

DETAILED DESCRIPTION - A particular process when becomes on line, the registration information of that process, is sent to the intelligent agent process and their details stored in the storage are dynamically updated. The registration information has a service registration for indicating the agent that the process is a server for a particular request. The registration information also includes a notification registration for sending notified **message** to particular process, or a process registration for indicating a particular process exists. The process registration includes information regarding socket number, host name and indirect addressing pattern. INDEPENDENT CLAIMS are also included for the following:

- (a) method for communicating between a client and a server in a network environment;
- (b) apparatus for controlling communication in a network environment

USE - For communication between multiple processes in telecommunication network such as undersea telecommunication networks.

ADVANTAGE - Since the intelligent agent process acts as a intermediary between a requesting process and all other processes, it provides all necessary communication information and enables the requesting process to receive service on its request in fast time as possible, without requiring the state of the other processes and their communication details.

DESCRIPTION OF DRAWING(S) - The figure shows the portfolio of services available to a user to administer and manage an undersea cable network.

Patent Details:

Patent No Kind Lan Pg Main IPC Filing Notes
US 5850594 A 17 H04B-007/26

Abstract (Basic): US 5850594 A

The system includes portable selective call receivers (105) for sending a recipient alias signal over a wireless communication channel. The call receiver maintains a list which includes recipient names and associated recipient alias and has a sender for requesting addition of additional recipient to the list. A controller (110) receives the recipient alias signal and transmits a message to a recipient alias designated address.

The controller has a database which stores the list associated with the call receiver. The controller has a processor for assigning and adding additional recipient alias and associated additional recipient name to the list maintained by the call receiver by transmitting a programming information to the receiver. The address to which the message is transmitted is longer than the recipient alias.

ADVANTAGE - Performs efficient message transmission. Prevents message delay due to overcrowding of channel. Enables user to enter message and address information conveniently. Increases probability of proper message delivery.

ABSTRACT

PROBLEM TO BE SOLVED: To make authentication including user's identification and content confirmation simple and easy to use even for a user who is not familiar with a password and ciphering technology.

SOLUTION: A program 22 which can compose and transfer digital contents by using a network 10 is provided with a sender identification mark storage part 35A and a recipient identification mark storage part 35B which save the identification marks of a sender and a recipient so that they can be displayed and a sender sign storage part 38A and a recipient sign storage part 38B which store the signs of the **sender** and **recipient** while keeping them **secret**. The **recipient** confirms the **sender** with the identification mark and does predetermined operation when the program 22 is transferred from the **sender** to the **recipient** and then the program 22 displays the sign of the **sender**. The **sender** confirms the **recipient** with the identification mark and does predetermined operation when the program 22 is transferred from the **recipient** to the **sender**, and then the program 22 displays the sign of the **recipient**.

ABSTRACT

PROBLEM TO BE SOLVED: To provide a method and a system which safely send a document to a communication network such as the internet.

SOLUTION: A document sending architecture dynamically generates a private uniform resource locator (URL) (PURL) 302 to distribute information. Each PURL 302 confirms a parameter of free selection which is peculiar to a receiver 320 of a document 310, a sending document 310 and a sending process on its own terms. The receiver 320 retrieves the document 310 with the PURL 302. A sender 300 commands a sending server 315 to retrieve the public key of the receiver 320. The server 315 dynamically collates an insurance source and retrieves the public key. The public key is sent from the server 315 to the sender 300. The sender 300 enciphers a **secret** key with the public key after enciphering the document 310 with the secret key. The document 310 and secret key which are enciphered are uploaded to the server 315 and sent to the receiver 320. The receiver 320 decodes the **secret** key with a decoding key that is related to the public key and decodes the document 310 with the **secret** key.

ABSTRACT

PROBLEM TO BE SOLVED: To provide a postcard in which after a regular addressee accepts the postcard, not only the addressee comparatively simply sees the contents, but also the **addressee writes secret** matters and sends the postcard to a sender and even in this case, the recording column of the secret matters is **hid** during mailing and after the **sender** accepts the postcard, the contents are seen comparatively easily.

SOLUTION: The postcard 10 contains a first base material 12, a second base material 16 formed through the pressurized adhesive layers 14a, 14b on the surface side of the first base material and a third base material 30 formed through a release agent layer 18 and a pressure-sensitive adhesive layer 20 on the surface side of the second base material 16. In this postcard 10, an addressee peels the first base material 12 in the pressurized adhesive layers 14a, 14b and thereafter separates the second base material 16 and the release agent layer 18. The first base material 12 and the third base material 30 are bonded by the pressure-sensitive adhesive layer 20

ABSTRACT

PURPOSE: To secure the confidentiality even when an ID number of one party is intercepted by a 3rd party and to detect the presence of a forged data by the 3rd party immediately by using both receiver and sender ID numbers.

CONSTITUTION: A basic decoding section D1 decodes a **sender** ID number by using a **secret** key S4 in common to the **sender** and the **receiver**. The **secret** key S4 is obtained by a selection section D1-2 selecting either a secret key S3 outputted from a secret key register section D3 or a receiver secret key S6 outputted from a receiver ID number register section D4. Then a decoded signal S5 is decoded by using the receiver ID number S4 and the decoded signal is outputted to a transmission line T1. A basic cryptographic section E1 of the receiver side ciphers the decoded signal S7 by using the receiver ID number S4. A decoded signal S8 generated from the basic cryptographic section E1 is inputted to a sender ID number verification section E2, in which a sender ID number outputted from a sender ID number register section D2 and the decoded signal S8 are compared.

ABSTRACT

PROBLEM TO BE SOLVED: To establish security which controls electric
equipment with an **electronic mail**.

SOLUTION: A modem part 21 receives an **electronic mail** sent from a
sending side and stores it in RAM(random access memory) 22c of a
controlling part 22. A CPU(central processing unit) 22a extracts
authentication information that is enciphered with a user's **secret key**. It decides whether
of the sending side and decodes it with a public key. It decides whether
the user of the other **sending party** is a normal user or not according
to the decoded information, and only in the case of a normal user, it
extracts a control command that is included in an **electronic mail** and
stores it in the RAM 22c. It resends an **electronic mail** that confirms a
control content to the sending side, and as a result, when an **electronic
mail** approving it is returned, it extracts 2nd authentication information
that is acquired by enciphering information that is different from the case
and reconfirms whether the **sender** of the **electronic mail** is a normal
user or not. In the case of a normal user, it carries out the control
command that is previously sent.

ABSTRACT

PROBLEM TO BE SOLVED: To protect call originator's privacy by making it possible to treat the call originator's (**sender's**) **name** of a received mail **without revealing** it at a receiving side mail terminal equipment. SOLUTION: In the case of originating an electronic mail constituted of mail **message** data provided with an area for storing call originator's privacy **message** identification(ID) data for judging whether a call originator's name is to be outputted to the mail **message** data or not from a mail terminal equipment 1, the call originator is allowed to set up call originator's privacy ID data and other data to prepare the mail **message** data. The data are originated as an **electronic** mail and stored in a mail box in a receiving side mail server 2. In the case of receiving the mail **message** data, a **receiver** is allowed to retrieve the mail box in the mail server 2, and at the time of opening the **electronic** mail, whether the call originator's name is to be outputted or not is evaluated in accordance with the call originator's privacy ID data. The call originator's name is not outputted on a display part 107 or the like in accordance with the evaluation.

JOURNAL: Section: P, Section No. 821, Vol. 13, No. 43, Pg. 79, January 31, 1989 (19890131)

ABSTRACT

PURPOSE: To obtain high confidentiality by constituting the titled system so that an **addresser** records information in a memory of an IC card, so that an **addressee** installs the IC card 1 to an interface device 4, and thereafter, executes a certifying procedure for the **addressee** himself (an input of a password, etc.) through an input device 12, so that

CONSTITUTION: When an input of desired information to an IC card 1 is ended, an **addresser** mails it to an **addressee** by an ordinary sealed letter, etc. The **addressee** installs the IC card 1 to an interface device 4, and thereafter, executes a certifying procedure for the **addressee** (an input of a password, etc.) through an input device 12, so that

the information of the IC card 1 can be read out of a memory 3, and the read-out information is displayed on a display device 11. In such a way, only the **addressee** who knows the password can read the information in the IC card 1, therefore, it does not occur that the information leaks out to a **third person**. In such a way, high **confidentiality** can be held.

Abstract (Basic): US 20020099941 A1

NOVELTY - A personal computer (PC) creates a common key from a public key generated on basis of email address of mailing list and a secret key generated based on email address of email sender. The PC encrypts the email data with the common key and sends the email including encrypted data to the email address of mailing list.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are included for the following:

(1) Email processing method;
(2) Computer readable recording medium storing email processing

program;

(3) Email sending apparatus; and
(4) Email receiving apparatus.

USE - For data communication.

ADVANTAGE - Prevents the necessity to encrypt email data on basis of email address of recipients, but can be encrypted based on the email addresses of the mailing list and sender when sending the same email to the recipients. Thus providing easier transmission of mail having encrypted data to recipient.

DESCRIPTION OF DRAWING(S) - The figure shows the flowchart explaining the email sending process of the personal computer.

Abstract (Basic): WO 200282293 A1

NOVELTY - The system has a mail server, a segregated server divided
up according to the sender, recipient and department of the
corporation using the system. The program can be executed to configure
access rights to the communication and to enforce them by managing
access to the communication. The programme executes automatically and
attaches the privileged attribute to particular communications
according to the predetermined selection criteria. A confidentiality
notice is displayed to the user and acknowledged before the
communication is displayed by clicking on a GUI button.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the
following:

- (1) a privileged email messaging service,
- (2) a method of creating an attorney-client privileged digital
communication,
- (3) a method for creating a digital communication protected by the
attorney-client privilege,
- (4) a method of creating a virtual container,
- (5) a digital communication system.

USE - System is for email routing.

DESCRIPTION OF DRAWING(S) - The figure shows a flowchart of the
steps in creating a privileged e-mail .

Abstract (Basic): WO 200251051 A1

NOVELTY - The proxy address on the postal mailpiece is detected to obtain the recipient postal address from a database which has recipient postal addresses and associated proxy addresses. The obtained postal address is affixed to the mailpiece so that it is delivered to the physical address of the recipient.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are included for the following:

- (1) Proxy addresses creating and maintaining method for use with postal mailpiece;
- (2) Recipient postal address identifying method;
- (3) Mailpiece delivery managing method;
- (4) Value added services providing method for mailpiece;
- (5) Postal mailpiece delivering system;
- (6) Recipient postal address identifying system; and
- (7) Article of manufacture comprising a machine readable storage medium storing program for detecting and delivering mailpiece to postal address of recipient.

USE - For delivering item to recipient home address in cases when recipient responds to advertisement, catalog or other notice for delivery.

ADVANTAGE - The proxy address allows mailpiece to be delivered to recipient without the sender knowing the recipient's postal address which is maintained secret, and hence provides value added services with flexibility. Reduces the chances of errors when sender places address on mailpiece and enables performing accurate delivery.

DESCRIPTION OF DRAWING(S) - The figure shows the flowchart illustrating postal mailpiece delivering method.

Abstract (Basic): KR 2002001159 A
NOVELTY - A method for preventing a spam mail is provided to prevent a spam mail which is sent to a **private person** at random.
DETAILED DESCRIPTION - An enterpriser supplying a mail service creates an ID indicating a subscriber included in the enterpriser's service member information, and registers at a member DB(S1,S2). The ID periodically connects and acts to a service as a real ID by a program(S3). **Senders** of the spam mail collect the IDs exposed to the service with general IDs and send all kinds of mails(S4,S5). When a mail is stored in a mail system(mail sever) of the company, the mail system judges whether the ID is included in **receiver** IDs by comparing the **receiver** IDs of the mail with a member information of a user(S6,S7). When the ID is included in the **receiver** IDs, the mail is a spam mail. When the mail is the spam mail, a transmission of the mail is reserved. When the ID is not included therein or the mail is not the spam mail, the mail is normally sent to the user's mail box(S8,S9,S10).

Abstract (Basic): WO 200182108 A2

NOVELTY - The user interface of a home page (100) preferably includes several display regions to enable access to various other features of the web site through navigation using hypertext links to the features (102-156). The greeting created by a registered user is transmitted to a receiving registered user in a perceivable form and the receiving user is provided with eligibility to win a reward, while the sending user is provided with a separate eligibility to win at least one reward not previously identified. The users are also given a point for completing a selected activity.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are included for a method and system for conveying a greeting through an interactive communication system, for methods of messaging and incentivizing creation of a greeting, for a networked system, for an apparatus and for a computer program product with code.

USE - Conveying greetings in a communication system.

ADVANTAGE - Incorporating a program of rewards.

KR 2001035202 A 1 G06F-017/60

Abstract (Basic): KR 2001035202 A
NOVELTY - An internet service for delivering commodities only using an address of a **sender** is provided to protect **private** life of famous **persons** by delivering a mail or a commodity to a famous person through a Web service based on the internet network.

DETAILED DESCRIPTION - A user joins to the membership by connecting to an internet Web service server(2) using a user computer(1) and inputting personal information to a database(9). The user can prepare a fan letter using letter editing program(11) and can up-load the letter on a notice board. If the user wishes to deliver a commodity to a famous person, the user connects to an information database service and searches and selects information with respect to the famous person and inputs one's address in a user address input program(5). The address data are transmitted from a temporary storing unit of the user address input program(5) to a Web server of the delivery company. The delivery company takes away a letter or a commodity of the user and delivers the letter or a commodity to a storehouse of the service provider. The letter or a commodity is separated by **receivers** and delivered to a place in which the **receivers** frequently visits. If the letter or a commodity was delivered normally, a manager up-loads the fact that the **receiver** received the letter or a commodity on the notice board.

Abstract (Basic): EP 946022 A2

NOVELTY - The method involves controlling accesses between a **sender** and a **recipient** by verifying an access right of the **sender**

with respect to the **recipient** according to the personalized access **ticket** at the secure communication service.

DETAILED DESCRIPTION - A certification authority (CA) (1) has a right to authenticate an official identification (OID) that identifies each **individual** and a right to issue **anonymous** ID (AID), and functions to generate AIDs from OIDs and allocate AIDs to users (3). A secure communication service (SCS) (5) judges whether or not to admit a connection in response to a connection request by an **email** from a user (3), according to the PAT (Personalized Access **Ticket**) presented from a user (3). **INDEPENDENT CLAIMS** are included for: a communication system, a secure communication device for use in a communication system realizing **email** access control and a program for causing a computer to function as a secure communication device realizing **email** access control.

USE - For **emails** or news that are unilaterally sent without any consideration to the **recipient**'s time consumption, economical and mental burdens. The SPAM using **emails** are also known as UBE (Unsolicited Bulk **Emails**) or UCE (Unsolicited Commercial **Emails**). The SPAM is sent indiscriminately regardless of the **recipient**'s age, sex, interests, etc., so that the SPAM often contains an uninteresting or unpleasant content for the **recipient**.

ADVANTAGE - Capable of enabling a unique identification of the **identity** of the **user** while **concealing** the **user** **identification**.

DESCRIPTION OF DRAWING(S) - The drawing shows an overall configuration of a communication system according to the first embodiment of the present invention.

ABSTRACT

PROBLEM TO BE SOLVED: To provide a method that enables a **user** to attach scripts for recording **private** data written on an electronic **name** card in a **recipient** address book.

SOLUTION: A PDA 1 displays a dialog box 641 if attaching an electronic **name** card to an **electronic mail** is instructed while the **electronic mail** is generated. If a **user** selects a YES button 642, the PDA 1 generates scripts for recording **private** data written in an electronic **name** card on a **private** data database like an **address** book stored in the PDA 1 owned by a **recipient** and sends the scripts attached to the mail to the **recipient**. The scripts are executed as soon as the mail is opened.

ABSTRACT

PROBLEM TO BE SOLVED: To provide an **electronic mail** server system that allows even if a terminal is incapable of possessing a plurality of mail addresses to attain transmission/reception of a mail **address** of an anonymous sender.

SOLUTION: A terminal transmits **electronic mail** to a server 4, by using a destination resulting from partly converting a destination mail address into another address and attaching a designation address to the converted address. A mail address collation section 6, receiving the **electronic mail**, uses the mail address to retrieve a database 7; a processing section 8 interprets the destination of the **electronic mail** sent by a designated address, when the mail address matches the mail address of the database 7, converts the **sender mail address** into an **alias mail address** of the database 7; an **electronic mail** transmission/reception control section 5 transmits the **electronic mail**, converts the **alias mail address** of the **electronic mail** into a mail address of the database user 7, adds the designated address to the user mail address and partly converts the resulting address; and the **electronic mail** transmission/reception control section 5 transmits the **electronic mail**.

ABSTRACT

PROBLEM TO BE SOLVED: To provide a method for exchanging electronic mail without publicizing an electronic mail address by an automatic transfer system putting emphasis on the protection of privacy and also easily selecting the opposite party of exchanging the electronic mail.

SOLUTION: The transmission and reception of the electronic mail utilizing the Internet 3 are performed by relaying an electronic mail server 1 where members are registered, and the electronic mail server 1 hides the electronic mail address of a mail transmitter and performs transfer to an electronic mail receiver.

ABSTRACT

PROBLEM TO BE SOLVED: To provide a future mail network system where a time difference transfer trust service center is prepared for the information on electronic mails, etc., to accumulate and preserve the electronic mail information which are sent from each of individual transfer trust transmitters and to automatically transfer the electronic mail information to a designated receiver on a future designated transfer date after the electronic mail information is retrieved and extracted unlike a conventional system where the event information are separately stored/preserved or stored by means of a recording medium, etc., and also desired to be transmitted to, to be confirmed by or to be taught to a user himself/herself or a third party on a future specified date for an organization of private persons, establishments, etc.

SOLUTION: The information on the electronic mails, etc., are transmitted from a transmitter to a service center after the receiver and the future transfer date and time are designated and then received, accumulated and preserved by a computer of the service center. These electronic mail information are retrieved, extracted and transferred automatically to a designated receiver on a future designated transfer date. This future mail network system is controlled by connecting the computer of the service center to the electronic information equipment such as personal computers of both transmitter and receiver via the Internet.

ABSTRACT
PROBLEM TO BE SOLVED: To anonymously exchange electronic mails by
properly selected two persons for a fixed time.

SOLUTION: In the electronic mail mediation serve, validity terms data
are made to be incidental to an anonymous correspondence pair which
consists of a temporary mail address A2 made to correspond to the mail
address A1 of a user A and of a temporary mail address B2 made to
correspond to the mail address B1 of a user B, an electronic mail is
transmitted to the Internet as the electronic mail from the temporary
address B2 to the address A1 when the sender of the electronic mail
transmitted to the mail box of the temporary address A2 coincides with the
address B1, the electronic mail is transmitted to the Internet as the
address B1, the electronic mail from the address A2 to the address B1 when the sender
of the electronic mail transmitted to the mail box of the temporary
address B2 coincides with the address A1 and the anonymous
correspondence pair and the mailboxes are erased base on validity terms
data.

ABSTRACT
PROBLEM TO BE SOLVED: To provide an electronic mail system which can
basically transmit an anonymous message, can send a reply to a specified
transmitter and accordingly can inhibit a wrong user from using the system
by means of the anonymity.

SOLUTION: This mail system includes a server device S which is connected to
an internet INET and a plurality of client devices C. Every device C
converts the text data, etc., inputted by a user into the image data of a

PNG form (format) and produces an **anonymous** mail that includes the **user ID** for the benefit of a **receiver** sending a reply. The server S stores the received **anonymous** mail in a mail box 30 and then selects preferentially the mail addressed to the user after another device C is logged in. The reception of mails of troublesome users can be rejected by registering these user IDs on the server S.

ABSTRACT

PROBLEM TO BE SOLVED: To provide an **electronic mail** server system with which an **electronic mail** is transmitted and received in accordance with the states of a transmitter and **receiver** who are themselves **anonymous**.

SOLUTION: Each **electronic mail** exchanging terminals 211 is provided with a means 212 for designating the **confidentiality** of a transmission source **address** in the case of transmission. An **electronic mail** server 201 decides a mail whose transmission source **address** is designated by 201, converts the transmission source **address** into an **anonymous address** (204), distributes the mail (202), decides the mail whose transmission source **address** is the **confidential address** (205) and restores the **anonymous address** to the **confidential address** (205) and returns it (296).

ABSTRACT
PROBLEM TO BE SOLVED: To make anonymous a sender name present on an actual transmission source address by including an alias transmission source address substitution unit and removing the actual transmission source address from an electronic mail message.

SOLUTION: A hash value of the destination address of an electronic mail message is calculated (S330). Then, (n) blank bytes are added to a compressed actual transmission source address (S340). The true length of the actual transmission source address is hidden by adding blank bytes. Further, a 2nd bit field is added to a secret key saved locally in a remailer, and an extended secret key characteristic of the destination address is generated. Then, the compressed actual transmission source address is ciphered according to the data ciphering standards using the extended secret key characteristic of the destination address as a cipher key (S350). Further, the 2nd bit field is added to the ciphered and compressed actual transmission source address (S360).

ABSTRACT
PROBLEM TO BE SOLVED: To provide the electronic mail system that protects privacy of an address such as a telephone number and creates an excellent electronic mail communication environment.

SOLUTION: The system is provided with an address data conversion section 105 that conceals or encrypts part or all of an address set by the address data setting section 104, and adds an address converted in the case of sending an electronic mail to a text mail as address information. Thus, in the case that pluralities of names of mail recipients are in existence, the privacy of an address such as a telephone number is protected against among recipients.

ABSTRACT

PROBLEM TO BE SOLVED: To enable an agent having a reception attribute specified by a transmitting entity to receive a message by ciphering the message by a cipher key corresponding to the attribute of a reception entity and transmitting the ciphered message to a receiver side device only when the receiver side entity has the specified reception entity.

SOLUTION: A certification request 1400 consisting of cipher information obtained by ciphering the certification request 1400 by a user's own secret key Ka, the information of a secret key certificate 400 for the user A and the information of a user attribute certificate 800 is prepared and sent to a server computer to request the certification of an attribute. The server computer checks whether the information of the certificate 400 can be correctly decoded by its own secret key Ks or not, and when the information can be correctly decoded, obtains the key Ka as the user's secret key. Then the server computer decodes the cipher information by the user's secret key Ka and certifies that the user A has an attribute specified by the attribute information. Then the server computer ciphers certification information 600 by its own secret key Ks to generate ciphered certification information 1700 and returns the information 1700 to the user A.

ABSTRACT

ABSTRACT

PURPOSE: To set automatically its own IP address to a computer subscribing
newly to a network.

CONSTITUTION: In the system where its own address comprising a network number part, a subnet number part and a host number part is set to a computer subscribing newly to a network such as a LAN using a protocol, the computer 402 sends an address mask request message in which sender addresses are all set to zero and ANDs a sender address included in a reply message received as a reply of the message and a subnet mask. Thus, the network number part and the subnet number part of its own address are decided, and its own address is set based on the AND of its OR and sum of the value of a host number part selected optionally in a range between '1' and a value less than 1's complement of the subnet mask.

ABSTRACT

ABSTRACT

PURPOSE: To omit the entry of a mail address for registration of an alias by using a mail address of a sender of a received mail and a mail address being a destination of the generated mail.

CONSTITUTION: Upon the receipt of an electronic mail by a mail reception section 11 of the electronic mail system 1, a mail analysis section 12 obtains a header part of a sender or the like of the mail and the header part and a text of the mail are displayed by a mail display section 13. When the sender is selected in this case, the mail address is given to a destination registration section 14. When a mail generating section 15 generates the mail, the destination of the mail is set at a destination setting section 16. When the set destination is selected in this case, the destination mail address is given to the destination registration section 14.

Abstract (Basic): JP 2002319977 A

NOVELTY - A database (30) is accessed to retrieve public address data of sender and private address data of transmission destination based on the respective address data included in the received e - mail . A new e - mail is produced by overwriting the public address data of the transmission destination over the private address data, while overwriting the private address data.

USE - For converting e - mail address while performing communication with computer network using mobile telephone.

ADVANTAGE - Ensures maintaining communication secrecy due to inherent nature of e - mail address.

DESCRIPTION OF DRAWING(S) - The figure shows a block diagram of e - mail address conversion system. (Drawing includes non-English language text).

Patent No	Kind	Lan	Pg	Main IPC	Filing Notes
-----------	------	-----	----	----------	--------------

Abstract (Basic): KR 2001087754 A

NOVELTY - A system and method for connecting an opposite sex between acquaintances by E - mail using a plurality of real names or assigned position information is provided to guarantee an **anonymity** property of a proposing **person** to some extent and enable the partner to decide actually when the person performs a proposal through an on-line.

DETAILED DESCRIPTION - A web server connects a client with an Internet communication. A member managing unit(51) stores and manages information of a user being connected through the Internet in a storing unit by using the client. An information input unit(52) receives a **receiver** and stores the **receiver** in the storing unit. A contents input unit(53) receives contents to be proposed and stores the contents in the storing unit. A transmitter input unit(54) receives a plurality of own names including an own name of an actual transmitter or a group name of the transmitter and stores in the storing unit. A contents transmitting unit(55) transmits contents being stored in the storing unit to the corresponding **receiver** through an on-line. A decision unit by using the client. An information input unit(52) receives a **receiver** and stores the **receiver** in the storing unit. A contents input unit(53) receives contents to be proposed and stores the contents in the storing unit. A transmitter input unit(54) receives a plurality of own names including an own name of an actual transmitter or a group name of the transmitter and stores in the storing unit. A contents transmitting unit(55) transmits contents being stored in the storing unit to the corresponding **receiver** through an on-line. A decision unit to the corresponding **receiver** through an on-line. A decision unit(56) receives a selection decision with respect to a propose-permitted scheduled person from the **receiver**. A result processing unit(57) transmits a result in accordance with inputted decision to the transmitter and the **receiver**. A payment processing unit(58) pays the price if the propose is completed.

KR 2001035484	A	1	G06F-017/60	

Abstract (Basic): KR 2001035484 A

NOVELTY - A method for sending E - mail by inputting **recipient** 's E - mail address at a domain name dialog box of web browser is provided to offer a convenience to a user in sending an E - mail by identifying the name of an E - mail **receiver** and a reading of the E - mail .

DETAILED DESCRIPTION - A user executes a web browser provided at a

wire/wireless terminal(s100), and inputs other person's E - mail address in a web browser URL input section(s101). The user connects to a server processing the current process(s102). An input screen for inputting an E - mail message by requesting an E - mail address is outputted(s103). The E - mail message is inputted and other items are set(s105). The inputted mail information is stored or transmitted to an external mail server(s106). A secret number is inputted(s108). If the secret number is verified, a user managing screen is outputted(s109). The user moves to the E - mail message input screen again for delivering new mail(s110). A receiving mail is opened for reading the received message(s111). After the user sent a message, the user receives a code number identifying whether the receiver reads the message, and thus the user identifies the reading by the receiver in real time.

Abstract (Basic): KR 2001016276 A
NOVELTY - A method and a system for sending an e - mail of an anonymous receiver are provided to sort an e - mail for anonymous receivers and to send to correct receiver.
DETAILED DESCRIPTION - A mail server(100) is adopted by a groupware system like a handy soft used in a company and an organization or an ordinary e - mail system like an e - mail express of Microsoft and processes a received mail and a transmitted mail. A mail received from an external and a mail transmitted to the external are temporarily stored in a mail storing unit(120). A study agent(200) receives the mail transmitted to the company or a member of the organization via the mail server(100) and performs a machine study using an algorithm. The study agent(200) generates a model of the mail transmitted to each member and stores the mail in a model storing unit. A judgement tree is stored as the study model of accounts of the mail by each receiver in a model database. A classification agent(300) refers to the study model generated by the study agent(200) in case that an e - mail of an

anonymous receiver without knowing an accurate address is arrived.

200080319 A G06F-017/30 Based on patent WO 200152106
Abstract (Basic): WO 200152106 A2
NOVELTY - The method involves receiving message and profile
information from the user computer. The message is provided to a list
of people from a database (56) without providing the user with names or
e-mail information of any of them.
DETAILED DESCRIPTION - An INDEPENDENT CLAIM is also included for
messaging system.
USE - Messaging over internet.
ADVANTAGE - Provides the message to a recipient without
providing name or e-mail information to the user as anonymity
of recipients is maintained.
DESCRIPTION OF DRAWING(S) - The figure shows the operation of
server.

Abstract (Basic): WO 200116695 A1
NOVELTY - An e-mail receiving server includes an authorized
senders list (ASL) module e.g. spam processor (203) which maintains an
ASL list (203b) of e-mail addresses of senders authorized to send
e-mail to a user. An e-mail rejection module e.g. redirector
(202), operable with the ASL module, rejects the e-mail addressed
to the e-mail address of the user if the e-mail address of the
sender is not in the ASL list.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the
following:

- (a) an unauthorized e-mail eliminating method;
- (b) an e-mail server system.

USE - For removing unauthorized e-mail sent to user on network
e.g. Internet.

ADVANTAGE - Can not be defeated by spammers who frequently change
their source addresses or disguise themselves. Enables rejection of
all unauthorized e-mails.

DESCRIPTION OF DRAWING(S) - The figure shows the process flow
diagram of anti-spam system.

Redirector (202)
Spam processor (203)

Abstract (Basic): US 6161129 A

NOVELTY - An alias address is generated in response to
instructions from a party with unlisted address . The alias
address and its corresponding unlisted address are entered in a
routing table. On receiving the message addressed to alias
address , the routing table is used to obtain unlisted address. The
message is then delivered to unlisted address . The alias address
is unique and is used once.
DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the
following:

(a) Messaging system;

(b) Messaging services provision program

USE - For use in communication-based messaging service such as

voice mail and electronic mail .

ADVANTAGE - Protects the privacy and security of users who do
not want unnecessary disclosure of personal information by use of an
alias address . Effectively restricts replies from any one other
than the intended recipients of the message .

DESCRIPTION OF DRAWING(S) - The figure shows flow diagram of
unannounced alias address messaging process.

Abstract (Basic): JP 2000049849 A
NOVELTY - An expansion unit (6) refers mail alias set in file (5) and develops alias to each mail address which are stored in address list. A memory stores the developed alias of each mail address, based on which mail is transmitted to network. A control unit (8) controls the flow of each data in the mail.

DETAILED DESCRIPTION - A receiver (1) receives electronic mail from a network, where header portion is analyzed by an analyzer (3). INDEPENDENT CLAIMS are also included for the following:
(a) electronic mail delivery procedure;
(b) software program for electronic - mail delivery
USE - In information communication network such as internet, computer.

ADVANTAGE - Enables transmitting party to send mail only to desired person using the existing alias, hence user 's burden is reduced.
DESCRIPTION OF DRAWING(S) - The figure shows functional block diagram of E - mail transmitting controller.

Patent Details:

Patent No Kind Lan Pg Main IPC Filing Notes
JP 10275119 A 6 G06F-013/00

Abstract (Basic): JP 10275119 A

The system performs the transmission and reception of an electronic mail between several workstations (1-3,5) in a communication network. Mail servers (4,6) for transmitting and receiving a predetermined mail between workstations with a communication medium, are connected to the communication network.

Each mail server registers and transmits the anonymity information corresponding to the transmitted mail, to a receiving party. The information of a transmitting party, which appends the mail, and the anonymity information are compared. The forwarded mail to the receiving party is returned back to the transmitting party when the information of the transmitting party is not in accord with the anonymity information, otherwise, the information of the transmitting party is made in anonymity and forwarded to the receiving party.

ADVANTAGE - Maintains safety of receiving party and anonymity property of transmitting party. Prevents mischief of transmitting several electronic mails .

Patent Details:
Patent No Kind Lan Pg Main IPC Filing Notes
JP 10232893 A 16 G06F-017/60

Abstract (Basic): JP 10232893 A

The apparatus has a database which stores self explanation
information transmitted by a public session member to offer search
perusal by an anonymity member client. Another database stores self
anonymity type explanation information transmitted by the anonymity
member to offer search perusal by public session member client except
the information specifying the name, address, communication destination
of calling party.

The screen information for filling in a comment information is
appended while sending anonymity information to public session member
client. The comment information that is entered and returned by public
session member client is received, and is stored in the database. An E
- mail is sent to the relevant anonymity member **addressee**. The
anonymity member who receives communication by the E - mail peruses
the relevant comment information.

USE - For significant information exchange between applicant and
job providing enterprises.
ADVANTAGE - Exchanges information legibly. Simplifies information
exchange service.
